# EMBOA PROJECT EVALUATION REPORT

Agnieszka Landowska, Michał Wróbel

#### ABSTRACT

This publication reports evaluation stage of the project EMBOA Affective loop in Socially Assistive Robotics as an intervention tool for children with autism. Multiple methods of evaluation have been applied in order to evaluate the final product of the project - ER-RIA Guidelines for Emotion Recognition in Robot-supported Interventions in Autism. The project final activity - training regarding the combination of social robots and emotion recognition technologies in autism therapy - was also evaluated.

Scope of the report:

- evaluation of final project training;
- evaluation of ER-RIA guidelines questionnaire;
- evaluation of ER-RIA guidelines focus groups;
- evaluation of ER-RIA guidelines AGREE instrument.

This publication was supported in part by the Erasmus Plus project of European Commission: EMBOA, Affective loop in Socially Assistive Robotics as an intervention tool for children with autism, contract no 2019-1-PL01- KA203-065096. This publication reflects the views only of the authors, and the Commission cannot be held responsible for any use which may be made of the information contained therein. ### 1. Introduction

In 2019 a project EMBOA on Affective loop in Socially Assistive Robotics as an intervention tool for children with autism was started. The project is executed by an interdisciplinary and international consortium of partners: Gdansk University of Technology, Poland; University of Hertfordshire, UK; Istanbul Teknik Universitesi, Turkey; Yeditepe University, Turkey; Macedonian Association for Applied Psychology, North Macedonia, and University of Augsburg, Germany. The EMBOA project aims at the development of guidelines and practical evaluation of applying emotion recognition technologies in robot-supported intervention in children with autism. The EMBOA project goal is to confirm the possibility of the application (feasibility study), and in particular, we aim at the identification of the best practices and obstacles in using the combination of the technologies. What we hope to obtain is a novel approach for creating an affective loop in child-robot interaction that would enhance interventions regarding emotional intelligence building in children with autism. The lessons learned, summarized in the form of guidelines, might be used in higher education in all involved countries in robotics, computer science, and special pedagogy fields of study. The EMBOA project combines three domains: autism therapy, social robots and automatic emotion recognition.

This document reports evaluation stage of the EMBOA project. Multiple methods of evaluation have been applied in order to evaluate the final product of the project - ER-RIA Guidelines for Emotion Recognition in Robot-supported Interventions in Autism. Multiple methods of evaluation have been applied in order to evaluate the final product of the project - ER-RIA Guidelines for Emotion Recognition in Robot-supported Interventions in Autism, including:

- questionnaire to obtain quantitative data;
- focus groups to obtain qualitative data;
- expert evaluation with AGREE instrument both qualitative and quantitative.

The project final activity - training regarding the combination of social robots and emotion recognition technologies in autism therapy - was also evaluated.

Scope of the report:

- evaluation of final project training;
- evaluation of ER-RIA guidelines questionnaire;
- evaluation of ER-RIA guidelines focus groups;
- evaluation of ER-RIA guidelines AGREE instrument.

### 2. Evaluation of the project final training activity

This section reports evaluation of the training for students on affective loop in robot-assisted intervention in children with autism (activity C3). The training was planned for 40 students: 20 foreign, and 20 local and was to be held by Gdansk University of Technology in Poland, Gdansk. Foreign participants were to be recruited by partners of GUT.

The training was conducted 30.05-3.06.2022 in Gdansk. We had 51 participants who took part in the training.

The training was organized as follows:

Day 1. Welcome, introduction to the project and training, information on goal, motivation and organisation, GUT campus tour, visit to Virtual Reality CAVE.

Day 2. Challenges in using technologies for children with autism.

Day 3. Challenges in using emotion recognition technologies.

Day 4. Challenges in robot-based intervention, practice with Kaspar.

Day 5. Working with ER-RIA guidelines, developed within EMBOA project

Each day held theoretical part (lecture) in hybrid mode and then practical part (laboratory work or workshop) held in F2F mode.

At the end of 5th day, the participants were asked to fill in a questionnaire to evaluate the workshop. The questionnaire was anonymous and 42 people filled that in. The questions were as follows:

- Q1 The topics covered during the training were relevant to me
- Q2 The training experience will be useful to me on the work
- Q3 The content covered useful and interesting material
- Q4 After the training workshop I know more about the applications of emotion recognition in therapy for children with autism
- Q5 After the training I feel more confident in using technology in autism therapy
- Q6 After the training, I understand the purpose of using social robots in ASD therapy
- Q7 What did you like the most about the workshop?
- Q8 In what ways the workshop could be improved?

Questions Q1-Q6 were closed ones with a symmetric 5-point scale ranging from "Strongly disagree" (1) to "Strongly agree" (5) with an "Undecided" middle answer (3). Questions Q7 and Q8 were open. The questionnaire is provided in Appendix 1.

Table 1 presents basic statistic metrics (mean, standard deviation and median) for the questions 1 to 6.

Question	Mean	SD	Median
Q1. Relevance	3,31	1,16	3,5
Q2. Usefullness	3,06	1,19	3
Q3. Interesting material	4,19	0,80	4
Q4. Knowledge (Emotion recognition)	4,67	0,48	5
Q5. Knowledge (Technology in autism therapy)	4,17	0,93	4
Q6. Knowledge (social robots)	4,64	0,53	5

Table 1.	Statistic	metrics	for Q	Q1-Q6	questions.
----------	-----------	---------	-------	-------	------------

Figure 1 presents distribution of answers for questions Q1-Q6.

Table 2 presents free-text entries for Q7 and Q8 open questions (in no particular order).

Figure 1. Answers distribution for Q1-Q6 questions

Q7. What did you like the most about the workshop?	Q8. In what ways the workshop could be improved?
Workshop with Kaspar	workshop doesnt need any improvement
focus group	more interaction with Kaspar and more video
	examples how it is used
learning how technologies help children with ASD	playing with Kaspaer "where is" game - using
	eyetracker
playing with Kaspar and eyetracker and physiological signals	sample code might be shown and distributed
questions were answered, such as why keep a human in	more advanced procedures learned
the loop or why use Kaspar	
emotion recognition	document on guidelines delivered earlier in the training
presentation about challenges faced during studies, and success stories	more focus groups
lectures and practical sessions being together on one	more detailed lectures, more details, group
day, technical applications for socia topics	presentations, working more together
lecture about autism therapy, meeting with Kaspar	pauses in the middle of theoretical parts
the assembly of committed people on both sides of	more background and more details during the
this; food	lectures
the lectures	more assistance with travel planning
nice people, food provided, no information overload	chat sheet for Polish phrases, more in-depth
	about computer science
super interesting topic, easy fo follow lectures, aproach ability of lecturers, snacks and breaks	tasks more connected to each other
training although being outside of my interest, was interesting and engaging	more Kaspar
play with robot	everything was great
possiblity of deeper understanding of other point of	it was very good
view	
meeting Kaspar	not do it during exams week!
experience to work with Kaspar and possiblity to see	none, it was fine :)
the technology myself to see how it actually works	
liked all the technical aspects, namely robot and its	nothing
usage, as well as emotion tagging	
speaking with dr Springer	could be more interesting exercices
testing out equipment like eyetracker or Kaspar	i didn't like the workshops on Monday
focus groups and summary	more engaging tasks
testing different kinds of devices, playing with Kaspar	was fine
new interesting subject, Kaspar is cool	work with children
practical parts including interactions with robots,	the workshops could be more interesting, more
eyetracking devices	prepared (more details)
meeting with Kaspar, trying some technologies	more practice hours
trying different devices for gathering data like	
eyetracker, GSR device	
UX research methods	
workshop with devices for monitoring emotions	
the lectures were very interesting	
lab on Wednesday	
interaction with Kaspar	

Table 2. The text entries for Q7 and Q0 open questions
--

Findings from the evaluation questionnaire on training C3 can be summarized as follows:

- the participants benefit most in the field of applications of emotion recognition in autism therapy and area of using social robots in autism therapy;
- the participants benefit also in the field of using technology in autism therapy;
- the participants found material useful and interesting (36 out of 42 participants rated 4 or 5, only 2 rated 2);
- the training relevance to participants and their current work neutral (relevance 21 agree vs. 14 not agree, usefulness at work 14 agree vs. 14 disagree);
- despite finding the workshop a bit out of their current matters, the participants evaluated workshop as a good one.

# 3. ER-RIA guidelines evaluation with a questionnaire

The first version of the guidelines was evaluated using a questionnaire, focus groups and expert's evaluation with AGREE instrument. The questionnaire regarded each of the guidelines separately. Each guideline was evaluated in terms of the following criteria:

- adequate amount of description with a 5-point symmetric scale ranging: too little too much (with 3 being the best grade);
- understandability of the guideline and its description with a 5 point agree-disagree scale (with 5 being the best grade);
- applicability of the guideline with a 5 point agree-disagree scale (with 5 being the best grade).

The questionnaire was handed over to 48 participants, who were asked to read guideline by guideline and answer the three questions per guideline. The participants were students who joined training on affective loop in robot-child interaction in autism therapy.

Table 3 provides general statistic metrics for all guidelines, while table 4 presents metrics for individual guidelines.

Criteria	Scale	Mean	SD	Median
Too little- too much description	1-5 (best: 3)	3,25	0,68	3
Understandibility	1-5 (best: 5)	4,57	0,69	5
Applicability	1-5 (best: 5)	3,985	0,98	4

Table 3. Statistic metrics for all guidelines.

Cuidalina	Description (3-best)			Understandablity (5-best)			Applicability (5-best)		
Guidenne	Mean	SD	Median	Mean	SD	Median	Mean	SD	Median
GEN1	3,19	0,68	3	4,32	0,84	5	3,98	0,87	4
GEN2	3,66	0,79	4	4,36	0,90	5	3,85	1,02	4

PROC6	3,68	0,73	4	4,36	0,79	4	3,49	0,95	3
PROC7	3,40	0,74	3	4,34	0,76	5	3,60	0,99	4
EMO1	3,00	0,66	3	4,60	0,68	5	3,55	1,18	4
EMO2	3,17	0,61	3	4,30	0,89	5	3,39	1,00	3
EMO3	3,04	0,59	3	4,50	0,78	5	3,57	1,15	3
EMO4	2,89	0,80	3	4,50	0,84	5	3,50	1,09	3
EMO5	3,26	0,61	3	4,50	0,66	5	3,57	1,17	3
RES1	3,07	0,58	3	4,62	0,61	5	4,02	1,06	4
RES2	3,41	0,72	3	4,65	0,60	5	3,85	1,25	4
RES3	2,85	0,76	3	4,39	0,91	5	4,17	1,10	5
RES4	3,26	0,65	3	4,76	0,48	5	4,53	0,73	5
RES5	3,04	0,52	3	4,38	0,86	5	3,91	0,87	4
REP1	3,02	0,54	3	4,52	0,72	5	4,24	0,97	5
REP2	3,48	0,78	3	4,39	0,95	5	4,29	0,94	5

REP3	3,15	0,51	3	4,72	0,69	5	4,54	0,81	5
REP4	3,20	0,58	3	4,63	0,61	3	3,93	1,06	4

Questionnaire results might be summarised as follows:

- for too little too much description, the average score was: 3,25 +- 0,68 (1 is too little, 3 is neutral, 5 is too much);
- too little description (with >=10 people rating 1 or 2) was pointed out for the following guidelines: GEN3, CH1, INT2, EMO4, RES3;
- too much description (mean score >3,5) was obtained by the following guidelines: GEN2, CH3, SYM1, SYM10, TECH5, INT1, PROC2, PROC6;
- average understandability for all guidelines was 4,57 +- 0,69 (5 strongly agree);
- less understandable (<4,5): GEN1, GEN2, TECH3, INT1, PROC2, PROC5, PROC6, PROC7, EMO2, RES3, RES5, REP2;
- only one guideline was rated under 4 with regard to understandability: PROC2 (3,97+-1,05);
- average applicability for all guidelines was 3,99 +-0,98 (5 point Likert scale, 5 strongly agree, 3 neutral)
- relatively lower applicability (average under 4) was scored for guidelines: GEN1, GEN3, CH1, CH4, TECH4, TECH5, INT1, PROC1, PROC2, PROC3, PROC4, PROC5, PROC6, PROC7, EMO1, EMO2, EMO3, EMO4, EMO5, RES2, RES5, REP4;
- very low applicability (under 3,5) was obtained for: PROC2, PROC6, EMO2 all of those had relatively low understandability as well.

Having the questionnaire results, we focused on the guidelines that were scored significantly lower and improved them to obtain 1.1 version of the guidelines.

### 4. ER-RIA guidelines evaluation with Focus groups

After getting familiar with guidelines and handling questionnaires, participants were invited to join focus groups. Each group had 6 up to 8 participants, and there were 7 groups in total. Each of those groups had to agree upon the following questions:

- Identify 5 items (guidelines) that are the least understandable (with justification)
- Identify 5 items (guidelines) that are the hardest to apply (with justification)
- List 3 guidelines that are the most valuable for therapists
- List 3 guidelines that are the most valuable for developers
- List 3 guidelines that are the most valuable for researchers
- Could any of the guidelines be removed (is not necessary)?
- Could any guideline be added to the list?

Table 5 presents answers to the first two issues - the least understandable guidelines and those hardest to apply.

Table 5. Free-text entries for focus groups open question on understandability and applicability

Guidelines that are the least understandable	Guidelines that are the hardest to apply
* PROC2 - some general information defining multi-	* PROC5

modality would be helpful	* PROC6
* PROC5 - think about baseline measurement instructions	* RES3 - need to provide taxonomy
* GEN3 - clearly defining the specific aspects of data	* RES2 - provide references
othered that are of personal in nature and require data	* PROC3 - guidelines to annotate
protection	Ŭ
* RES3 - more examples of characteristics	
* PROC2 address contradictions between the midelines	
* EMO section answers WHY question instead of HOW	
* guidelines are generally understandable, but some of them	* multiple devices more cost
guidelines are generally understandable, but some of mem	* DBOC5 hard to record a baseling for a shild
are too detailed of fack some details	* PROCS - hard to record a baseline for a child -
* SY MIO - can be generalized to include also the visual	some methods would be userul
material from the camera - when therapist is also in the	* SYM3 - should camera be covered?
video, this can help to automatically detect the child's face	* hard to get access to a room/ space that meets all
only	standards (illumination, noise level)
* rather than using 2 cameras it may be added a gimbal	* PROC2 - multiple modality and facial expression
camera to detect and catch child's movement	is hard to achieve and monitor live
* TECH3 - about the microphone could be generalized to	* illumination - standard approach and its impact on
all wearable sensors	children
* GEN3 - we should add that the children can stop the	
interaction when they don't want to continue	
* PROC2 - difficult to read, addresses some things at the	* PROC2 - how to solve
same time, consider splitting into 2	* REP4 - no clear naming, no definition of
* PROC7 - phrasing is hard to read, intent not clear, they	emotional states
won't understand that guideline	* EMO1-3 - no solution/help what to do in this
* SYM1 - instead of distance it should be specified which	situation
frame you want (i.e. face should be visible), face fully on	* PROC7 - nothing to evaluate, nothing to do about
frame	it, how to mitigate
* INT1	
* REP2	
* SYM1, SYM2, SYM3 - all focus on the camera	
* SYM2 - should refer to all equipment (not only to a	
* SYM2 - should refer to all equipment (not only to a camera)	
<ul> <li>* SYM2 - should refer to all equipment (not only to a camera)</li> <li>* large number of guidelines makes it hard to focus -</li> </ul>	* hard to obtain recommended microphone

* PROC5 - child baseline - what does it mean	tagging it is a challenge as well
	* EMO section - more facts than guidelines

Focus groups results on understandability and applicability might be summarised as follows (the numbers in parenthesis indicate the count of focus groups that mentioned the issue):

- large amount of guidelines (2), add page numbers (1);
- repetitions (3), contradictions (3)
- the least understandable: PROC2 (4 times), PROC5 (3 times), GEN3 (3 times), single occurrences: RES3, SYM10, TECH3, PROC7, SYM1, INT1, REP2, INT5
- the hardest to apply: all EMO guidelines (3), PROC2 (2), PROC5 (2), RES2 (2), REP4 (2), single occurrences: CH4, PROC3, PROC6, PROC7, TECH4, SYM3, SYM6, SYM9, REP3, RES3;

Focus groups provided a lot of useful qualitative information - not only on what to change, but how to improve the descriptions. Having the focus groups results, we improved guidelines according to the remarks (most of them) to obtain 1.1 version of the guidelines.

None of the groups suggested removal of any guidelines, they rather suggested merging: CH1 + CH2 + CH3 + SYM2, SYM4 + SYM5, SYM7 + SYM8, merge SYM6 + SYM7 + SYM8, INT2 + TECH5, GEN3 + TECH1. The groups also suggested guidelines/issues to be added. Those are summarized in table 6 (divided into those addressed rejected and qualified as future works).

Issues addressed in ER-RIA	Issues - rejected	Issues - future works
version 1.2	(justification in parenthesis)	
<ul> <li>* show to users or developers specificity of working with children with autism e.g. each child should be treated individually</li> <li>* therapists familiarization stage</li> <li>* order CH4 before CH1 - the context should be always first</li> <li>* better description of equipment is needed to perform a research - consider this</li> <li>* how to familiarize with environment</li> <li>* close the boxes, missing spaces after dots and typos</li> <li>* technical requirements should be more distinct</li> <li>* evaluation of things that suppose to be mitigated, put some references</li> <li>* more information about the privacy</li> <li>* explain how ECG is related to emotions</li> <li>* REP3 - provide more details</li> <li>* missing information on how to synchronize all devices</li> </ul>	<ul> <li>* general guideline about the speech, appearance and movement while interacting with children with autism (it would be very hard to generalize a guideline for all modalities, we think it would be less understandable)</li> <li>* standard general setup (we think there is no standard setup - setup should follow the purpose)</li> <li>* naming of states of emotions - consider proposing the new one (this is a task for psychologists, who struggle with this for years, there is lot of literature about it)</li> <li>* more precise information about therapist present during the session (hard to foreseen and propose a guideline about it)</li> </ul>	<ul> <li>* perhaps a guideline towards future automated interaction</li> <li>* closing the loop mentioned in the guidelines</li> <li>* add a short check-list for therapists</li> <li>* consider the order of the guidelines, consider: before the session, during the session, after the session</li> <li>* how to cooperate - researcher/therapist/developer</li> <li>* new approach to describing technical stuff (do not focus the guidelines on existing technologies, make guidelines more general, high level and then what equipment to use and how</li> <li>* provide a recipe for conducting research, e.g. show which points are crucial and which ones are voluntary</li> </ul>

Table 6. Free-text entries for focus group question on any guideline to be added

The guidelines are developed for three target groups: autism therapists, technology developers, and researchers. We are aware that addressing this diverse audience might cause some applicability confusion - guidelines valuable for one group, might be neglected by the other one. Therefore we asked focus groups to point out the guidelines valuable for each of the target subgroup. Table 7 shows detailed entries for the most valuable guidelines.

Most valuable for therapists	Most valuable for developers	Most valuable for researchers
SYM7	PROC1	RES3
SYM8	PROC2	REP3
INT1	CH2	REP4
RES3	EMO1	RES5
all SYM guidelines	RES2	all res
all SYM section is a good instruction	PROC7	PROC7
for therapists	RES2	RES2
-		RES4
TECH5	CH1, TECH4 - signal quality	RES4
INT4	test setup should be easy to install -	RES3
INT3	no guideline for that	RES5
the whole INT section is useful	PROC1	last two sections (RES, REP)
INT2 - should also precise that	EMO1 - for developers that work	
caregivers and therapists should	on emotion recognition module,	
know how to use the tool	also important for labeling	
	EMO4	
all that answers: how to conduct a	all EMO-related	RES4
study	GEN1 and GEN3 - put child first	REP3
GEN3	TECH5	RES2
familiarization stage	INT2	PROC5
INT3	PROC1 - data processing and	
INT1	synchronization	
section INT	PROC section	RES section
REP section (specifically REP2)	SYM section	CH section
TECH section (in case of technical		quality of data - understanding
person missing)		limitations of work with children
		with autism
TECH section - fills in some	PROC section - data processing	CH section
technical knowledge	matters	
PROC1	TECH2, TECH3 - programming	
	calibration	
TECH section - fills in some	SYM10	RES section
technical knowledge	TECH2	EMO section
PROC1	TECH3	(hard to choose 3 out of them)
adjustment of tasks to a child		
TECH section, if missing technical		
person support		
GEN2 - how to start		
a lot of valuable for this group		

Table 7. Free-text entries for focus groups open question on the most valuable guidelines for specific target group

The guidelines that are the most valuable for **therapists** are as follows:

- GEN2 and GEN 3 to start with;
- all guidelines in SYM section to get familiar how symptoms of emotions are captured;

- all guidelines in INT section that provides hints how to plan and conduct interaction;
- all guidelines in TECH section, if missing technical person support.

The guidelines that are the most valuable for **technology developers** are as follows:

- GEN1 to put the child first and GEN 3 to comply with ethical requirements, such as privacy;
- all guidelines in PROC section how to process the data;
- all guidelines in EMO section that describes the specificity of emotional symptoms expressed by children with autism;
- TECH2 to TECH5 technical requirements for technologies developed;
- CH1 and CH2, INT2.

The guidelines that are the most valuable for **researchers** are as follows:

- all guidelines in RES section those are the guidelines how to deal with studies on robotchild with autism interaction;
- all guidelines in REP section that describe how to report the studies;
- selected guidelines in CH and EMO sections to understand limitations of work with children with autism and to be able to evaluate data quality;
- PROC5 and PROC7.

### 5. ER-RIA guidelines expert evaluation with AGREE instrument

The guidelines were evaluated by 3 experts using AGREE (The Appraisal of Guidelines for Research and Evaluation), which is an instrument to evaluate the process of practice guideline development and the quality of reporting. The AGREE II refined version was used - it comprises 23 items organized into 6 quality domains plus 2 general items. The domains are: scope and purpose, stakeholder involvement, rigour of development, clarity of presentation, applicability, and editorial independence. AGREE instrument was developed to evaluate guidelines for medical interventions, but is applied as well in therapeutic domains. As the ER-RIA guidelines are not medical ones we have adjusted the instrument in the following way:

- we excluded question 11: The health benefits, side effects, and risks have been considered in formulating the recommendations (domain 3);
- we excluded question 16: The different options for management of the condition or health issue are clearly presented. (domain 6);
- in question 2 (domain 1) we replaced "health question" with "study question".

Individual guidelines evaluation results are available in Table 8. Table shows both evaluation by individual experts and aggregated score. Please note, that AGREE total score is calculated according to formula from AGREE II documentation [1] and is represented as a percentage - range <0-100>.

Domain scores of AGREE evaluation per individual guidelines are provided in table 9. Scores for domains were calculated according to the same formula as the total score.

Individual ex		dividual expe	rts	All experts

The results of expert evaluation might be summarised as follows:

- the general "quality of this guideline" item had a score of 6,12 (using 1-7 Likert's scale with 7 being the best grade);
- the general "recommend this guideline for use" item had a score of 2,9 (using 1-3 scale with 3 being the best grade);
- out of 23 items 20 were scored over 6 (7- point scale);
- the following items were scored lower than 6:
  - a procedure for updating the guideline (4,95),
  - the guideline describes applicability (5,73),
  - the guideline presents evaluation criteria (5,02);
- qualitative remarks included (among others):
  - a statement that the funding body didn't influence the content of the guidelines should be added next to the funding acknowledgement;
  - o adding some references to improve body of knowledge visibility in guidelines;

- RES group of guidelines is more general and applies not only to robot-child studies in autism therapy;
- EMO guidelines are more descriptive in nature and do not contain remedies or recommendations what to do.

Having the AGREE instrument results, we improved guidelines according to the remarks (most of them) to obtain 1.2 version of the guidelines - see summary section for the list of changes.

### 6. Summary

Having the guidelines evaluated with the three methods, we have significantly improved the descriptions. Some major changes included:

- merging guidelines (49 in version 1.0, 46 in version 1.1 and 44 in version 1.2);
- addressing repetitions and contradictions between the guidelines; adding page numbers;
- adding a statement on independency of guidelines development from funding body;
- adding more information on how the guidelines was developed (section 3);
- adding a section on evaluation and monitoring of the guidelines (section 5);
- adding information on applicability (section 6);
- improvement of descriptions of almost all guidelines (with special focus on the ones mentioned in focused groups, and those that scored less in questionnaire and/or AGREE instrument results).

This document is the product of an international project EMBOA funded by European Union programme Erasmus Plus. This document is distributed free of charge on CC-BY open licence. The document is available at EMBOA project website http://emboa.eu/ in English, Polish, Macedonian, German and Turkish. The document is free to re-distribute.

Although the project ends in 2022, we plan to perform further research on the topic, and perhaps extended the guidelines. Some of the ideas of further development - some of them were suggested during evaluation process or resulted from project team observations - but were not addressed so far due to being outside of the scope of the project:

- developing guidelines towards future automated interaction in order to close the affective loop mentioned in the guidelines;
- define future technologies, rather than providing guidelines how to deal with currently available ones;
- provide recommendations for the cooperation between the target groups researchers, therapists, and technology developers;
- divide the guidelines to "during design" "before session" "within session" "posthoc" categories.

### Annex 1. Training questionnaire

EMBOA Intensive programmes For higher education learners Gdansk, 30.05.2022 - 03.06.2022

Affective computing and social robots in the therapy of children with autism

#### Training evaluation

#### Please indicate to what extent you agree with the following statements.

1. The topics covered during the training were relevant to me.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
				X

#### 2. The training experience will be useful to me on the work.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
	X			

#### 3. The content covered useful and interesting material.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
			X	

After the training workshop, I know more about the applications of emotion recognition in therapy for children with autism.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
				×

5. After the training, I feel more confident in using technology in autism therapy.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
				X

#### 5. After the training, I understand this purpose of using social robots in ASD therapy.

Strongly disagree	Disagree	Undecided	Agree	Strongly agree
				X

6. What did you like the most about the workshop?

Workshop with Kasper

#### 7. In what ways tej workshop could be improved?

1	betive	46-0	woleshop	doesn \$\$	heed	eng	inposement.	

### Annex 2. Individual questionnaire on guidelines

# Guidelines for emotion recognition in robot-based intervention in autism

### **Individual Questionnaire**

For each guideline: read, then evaluate according to the criteria on 5-item scale by underlining, crossing or putting in a circle.

Guideline	Criterion	Evaluation						
	Guideline is described:	Too little	1	2	3	4	5	Too much
GEN1	Guideline is understandable:	Do not agree	1	2	3	4	5	Do agree
	Guideline is easy to apply:	Do not agree	1	2	3	4	5	Do agree
	Guideline is described:	Too little	1	2	3	4	5	Too much
GEN2	Guideline is understandable:	Do not agree	1	2	3	4	5	Do agree
	Guideline is easy to apply:	Do not agree	1	2	3	4	5	Do agree
	Guideline is described:	Too little	1	2	3	4	5	Too much

### Annex 3. Focus group report on guidelines

### Guidelines for emotion recognition in robot-based intervention in autism

### **Focus Group Report**

Group together (6-8 people) and discuss the guidelines document with regards to the following topics.

1. Identify 5 items (guidelines) that are **the least understandable** (list guidelines by code and add information on what is not understandable)

2. Identify 5 items (guidelines) that are **the hardest to apply** (list guidelines by code and add information on why they are the hardest to apply)

- 3. List 3 guidelines that are the most valuable for therapists
- 4. List 3 guidelines that are the most valuable for **developers**
- 5. List 3 guidelines that are the most valuable for researchers
- 6. Could any of the guidelines **be removed** (is not necessary)?
- 7. Could any guideline **be added** to the list?
